

# Oswaldo Bueno's FetchSpecification Addition

Add this code to the end of any other `_Entity` superclass template to add Model-Specified FetchSpecifications to the `_Entity.java` file.

```
#foreach ($fetchSpecification in $entity.sortedFetchSpecs)
#ife (true || $fetchSpecification.distinctBindings.size() > 0)
    public static NSArray<${entity.className}> fs${fetchSpecification.capitalizedName}(EOEditingContext context,
NSDictionary<String, Object> bindings) {
        EOFetchSpecification spec = EOFetchSpecification.fetchSpecificationNamed("${fetchSpecification.name}",
"${entity.name}");
        spec = spec.fetchSpecificationWithQualifierBindings(bindings);
        return context.objectsWithFetchSpecification(spec);
    }
#end
    public static NSArray<${entity.className}> fs${fetchSpecification.capitalizedName}(EOEditingContext
context#foreach ($binding in $fetchSpecification.distinctBindings),
        ${binding.attributePath.childClassName} ${binding.name}Binding#end)
    {
        EOFetchSpecification spec = EOFetchSpecification.fetchSpecificationNamed("${fetchSpecification.name}",
"${entity.name}");
#ife ($fetchSpecification.distinctBindings.size() > 0)
            NSMutableDictionary bindings = new NSMutableDictionary();
#foreach ($binding in $fetchSpecification.distinctBindings)
                bindings.takeValueForKey(${binding.name}Binding, "${binding.name}");
#end
            spec = spec.fetchSpecificationWithQualifierBindings(bindings);
#end
        return context.objectsWithFetchSpecification(spec);
    }
#end
```
