

# Web Services-Controlling Enterprise Object Serialisation

To control what attributes and relationships are serialised for an EO, subclass the *WOEnterpriseObjectSerializationStrategy* class and create one of your own. You should subclass the method *keyPathsForSerialization(...)* method and return a list of key paths (attributes or relationships) that you would like to see serialised with the EO. Finally, to register this with a given web service (that is not D2WS), use something like *WOEnterpriseObjectSerializationStrategy.setStrategyForService(new MyEnterpriseObjectSerialisationStrategy(),"MyWebService",null)*; where "MyWebService" is the name that you used to initially register the service with *WOWebServiceRegistrar*.
