

Development-Examples-Anchors

Put the following in the superclass for your components:

```
private String anchor;

public void appendToResponse(WOResponse response, WOContext context) {

    if (anchor != null) {
        response.setHeader(context.componentActionURL() + "#" + anchor,
"location");
        response.setHeader("text/html", "content-type");
        response.setHeader("0", "content-length");
        response.setStatus(302);
        anchor = null;
    } else {
        super.appendToResponse(response, context);
    }
} // appendToResponse

public String getAnchor() {
    return anchor;
}
public void setAnchor(String s) {
    anchor = s;
}
}
```

In the component where we want to use an anchor you just put in

```
<a name="myanchor"></a>
```

and something like the following in the code where we want to jump to this anchor:

```
protected WOComponent doSomethingAndJumpToAnchor() {
    // do something :)
    setAnchor("myanchor");
    return null;
}
```
