## Introduction

A WOSubmitButton element generates a submit button in an HTML page. This element is used within HTML forms.

## Usage

```
WOSubmitButton {  
  action=submitForm; | directActionName=anActionName; actionClass=className;  
  value=aString;  
  [disabled=aBoolean;]  
  [name=aName;] ...  
}
```

## Bindings

action	Action method to invoke when the form is submitted.
actionClass	The name of the class in which the method designated in directActionName can be found. Defaults to DirectAction.
value	Title of the button.
directActionName	The name of the direct action method (minus the "Action" suffix) to invoke when this element is activated. Defaults to "default".
disabled	If disabled evaluates to true, the element appears in the page but is not active. That is, clicking the button does not actually submit the form.
name	Name that uniquely identifies this element within the form. You may specify a name or let WebObjects automatically assign one at runtime.

## Examples

### Java methods

### WOD-style

### Inline bindings (WOOGNL)
