

# Project WONDER-Frameworks-Ajax-AjaxInPlaceEditor

## AjaxInPlaceEditor

AjaxInPlaceEditor provides a WOTextField-like wrapper around the Scriptaculous In-Place Editor. This control provides rich-text editing with an optional on-the-fly replacement of rendered HTML text (i.e. toggleable edit mode).

A demo of the Scriptaculous In-Place Editor is available [here](#).

## Wonder Bindings

- value (required) - the value of the editor's content
- elementName - the name of the HTML element containing the text ("div" or "span")
- class - the CSS class of the HTML element containing the text
- id - the ID of the HTML element containing the text
- dateFormat - a date formatter (like WOTextField) for handling date values
- numberformat - a number formatter (like WOTextField) for handling number formats
- formatter - a formatter (like WOTextField) for handling other formats
- useDecimalNumber - whether or not to use BigDecimals
